Silobolsa™ Plastar

Silobolsa™ is a technique used for different products storage: dry grains in commercial conditions, seeds, fertilizers, high moisture grains, silage, etc. Dry grains mostly stored are: soybean, corn, barley, wheat, sunflower, rice, sorghum, rapeseed, etc.

Silobolsa™ system allows you to make important savings in marketing costs and solve key issues in storage and logistics.

Corn, sorghum, and chopped pastures are stored In Silobolsa™ for fodder, lactic fermentation takes place while maintaining nutritional properties similar to that

of live grains.

The latter is achieved by using moist grain baggers with crush broken and highly moistened grain, producing a lactic fermentation that results in a product of excellent nutritional quality.

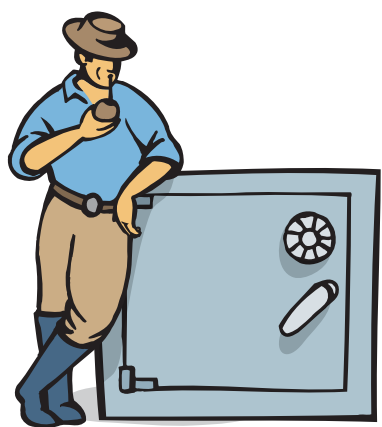

We also manufacture Silobolsa™ Elastic Tubes used for High moisture bales storage. In the Silobolsa™ Elastic Tube lactic fermentation takes place making animal food more palatable. Silobolsa™ Elastic Tubes is manufactured using special additives which results in better flexibility and stretching.

SILOBOLSA™ types and sizes:

SILOBOLSA™ come in 10, 9, 8, 6 and 5 foot diameter and in 60, 75 and 100 meter-long styles.

Diameter (foot)	Length (meters)	Capacity (tons)
5	60	55 / 60
6	60	90 / 100
9	60	200 / 210
9	75	250 / 260
9	100	330 / 340
10	60	240 / 250
10	75	300 / 310
10	100	400 / 410
